# Ads & product handoff

For Arya | Meera Labs | 25 October 2026

| | |
|---|---|
| **RELEASE** | Tracking repairs published to **www.himeera.com**. |
| **META RECEIPT** | **PageView** and **Complete registration** are active. Events Manager showed 652 and 9 events respectively; Diagnostics showed no active errors. |
| **PAYMENT SIGNALS** | Server-verified checkout/purchase counts are integrated. First real payment receipt in Meta still needs verification. No live charge was made. |

## What changed

**Attribution:** registered direct UTM URLs now create first-party attribution cookies before Google signup. Growth links and the home-to-sign-in redirect retain valid Meta click IDs.

**Signup accuracy:** returning sign-ins cannot create new signup attributions. Retries recover the original signup event ID; blocked or slow pixel loads retain pending events for a bounded retry.

**Payment accuracy:** client-supplied amounts or success flags cannot create purchases. Payment ownership, stored status and a positive amount are checked; free/bypass and refunded payments are excluded.

**Performance:** homepage first-load JavaScript fell from 768 kB to 262 kB in the Vercel build report (about 66%). Chat loads when needed; Cashfree loads when Indian checkout opens.

**Landing page:** public content renders while the session is checked. The sign-in page supports browser zoom, uses its own canonical URL, and has stronger text contrast.

## Meta restriction: counts only

The live dataset is categorized as **Health and wellness - other**, with **Core Setup** active. Checkout and purchase events send no value, currency, product details or other custom parameters. Use Meera analytics for verified revenue; do not claim Meta revenue/ROAS measurement is complete.

## Evidence and limits

**Passed:** 14 focused tests, TypeScript, targeted lint on 24 source files, the Vercel production build, and 14 checks against the staged deployment. No runtime errors appeared in the one-hour scan of the audited API routes. The Meta totals above describe the displayed reporting window (27 Sep - 24 Oct); they are not campaign-attributed customers.

**Mobile audit:** Accessibility 100, Best Practices 100, SEO 100. First paint 1.5 s; layout shift 0. Lighthouse returned NO_LCP, so the aggregate performance score is unscored; no field Core Web Vitals pass is claimed.

# Arya's operating sheet

Use one registered link per campaign or creative test. Keep the current spending cap unchanged.

## Campaign link ready to use

https://www.himeera.com/r/meta-us-lifetime-99-oct2026

| Source | Medium | Campaign |
|---|---|---|
| meta | paid_social | us_lifetime_99_oct2026 |

The direct /sign-in URL with this same UTM tuple is also supported. This repairs future attribution; earlier untracked visits cannot be reconstructed. Create new links in Meera Analytics > Links before new tests.

## Daily scorecard

| Record | Source / definition |
|---|---|
| Spend, impressions, link CTR, CPC, landing-page views | Meta Ads Manager, account 1628584825378260. |
| New signups, activation, paid customers | Meera analytics, filtered to the registered campaign. Exclude internal QA. Record the exact activation definition. |
| Revenue and costs | Verified paid records; keep INR and USD separate. Signup CPA = spend / attributed new signups; leave undefined when signups are zero. |

Align reporting windows: the saved ad configuration uses Asia/Kolkata; Meera dashboard calendar boundaries are UTC. Convert timestamps to the same window before comparing totals. Pixel receipts, ad-attributed conversions and first-party signups are different measures.

## Next actions and remaining gates

**1. Account access:** sign in to the Instagram identity that owns ad account 1628584825378260. The available Facebook session could access the correct dataset but did not list that ad account; Instagram was signed out. Current spend/CPA/ROAS was not independently verified.

**2. Validate the next conversion:** follow the registered link, complete a fresh confirmed signup, and check one first-party attribution plus one deduplicated registration in Events Manager. Mark internal tests as QA. Check Purchase receipt after the next legitimate paid transaction.

**3. Keep the test controlled:** the last saved configuration was a USD 19 lifetime replacement campaign ending 30 Oct 2026 at 02:52 IST, optimizing landing-page views. Recheck the live settings before changing optimization or increasing budget.

**4. Known measurement limits:** CAPI is not configured; browser blocking can still undercount. Core Setup limits shared data. Do not invent conversions or rename restricted events to evade a restriction.
